

ABSTRACT OF THE DISCLOSURE

A data warehousing system, method, and logic for use with a plurality of uniquely-identifiable data capturing devices, and a warehouse for storing multiple sets of captured data from each device according to an identity of the device that captured each data set. The warehouse may comprise a service for that uniquely-names each data set from a single capture device and a service that maps the data sets to a domain of the warehouse corresponding to the device that captured the data set. The warehouse may also comprise a service that registers each data capturing device to an owner and a service that synchronizes data sets in the capturing devices with data sets in the warehouse.
